Applied Analytics Project - Week 14 Assignment

Group Forecast and Furious Peer Review

Overall GitHub Structure

- The project uses the cookie cutter template that was recommended at the start of the class, but there are a few unused folders.
- Each file is well labeled with a clean title, which makes it easy to follow the work progression.
- Overall, the GitHub structure is very clean with no major flaws besides the redundant folders.
- We recommend changing the name of the first report to “Week 1” as the current title makes it easy to assume that it is the final report.

Code/Notebook

- The final notebook is very well structured and detailed.
- The commentary makes it much easier to understand the function of each section of code and is easy to follow along with.
- The notebook is quite long and can feel overwhelming at times, so shortening the model testing section would help reduce repetitiveness.

Code Output

- Every output generated is clearly visible while also providing quality insights.
- Some outputs are unnecessary, such as pip install outputs and grid search outputs.
- There are a lot of confusion matrices in the notebook, so converting some of them into smaller tables would help reduce the size of the notebook.

Project Report

- The report is well detailed and covers all important topics by following the MDLC format.
- A conclusion section would have paired well with the model performance table.
- The report does not mention any future plans or deployment considerations for the project.
